Polyclone Bioservices to focus on genotyping

Bangalore-based Polyclone Bioservices has added genotyping into its arsenal of technologies and expertise. Polyclone would focus on genotyping-based research in the diagnostic and agricultural sectors and offer services to both Indian and global customers.

The global market for genotyping is estimated to be around \$700 million. While Polyclone would be amongst the few companies in India to offer genotyping services, its value-add to its customers would be the packaging of bioinformatics services to analyze the mutation data generated by genotyping systems, which is critical to make sense of the data and to take informed decisions.

Polyclone plans genotyping research projects to identify and characterize mutations specific to Indian races to develop diagnostic assays for cancers of national importance. Apart from research, Polyclone would offer services for detection of cancer, infectious and genetic diseases to diagnostic labs and hospitals through a centralized setup.
